ANIMAL UNITS OF LIVESTOCK FED ANNUALLY
1909 to 1953

This report brings to date the data on animal units reported in "Animal Units of Livestock Fed Annually, 1919-20 to 1948-49" (F.M. 64 revised) issued by the former Bureau of Agricultural Economics in October 1949. It includes a preliminary estimate by States for the 1953-54 feeding year. These preliminary estimates are based on the numbers of livestock on farms January 1, 1954, on the pig crop report of December 1953, on the report of cattle on feed issued in January 1954 and on the report of intentions to raise turkeys dated January 15, 1954. The animal units for chickens to be raised in 1954 were obtained by multiplying the 1953 figures for each State by 105 percent. The number of broilers to be raised in 1954 was also assumed to be 105 percent of the number raised in 1953.

Three sets of animal units are presented in this report (1) grain-consuming livestock, (2) roughage-consuming livestock, and (3) grain-and roughage-consuming livestock. Animal units of grain-consuming livestock are intended to show the number of all kinds of livestock combined that consume concentrated feeds of all kinds, including grain and byproduct feeds but excluding corn in silage. Animal units of roughage-consuming livestock are intended to show the number of all kinds of livestock combined that consume hay, silage, stover, straw, pasture, range forage, and other roughages. Animal units of grain-and roughage-consuming livestock are intended to show the number of all kinds of livestock combined that consume all feed, including concentrates, hay, pasture, and other roughage.

Animal units were constructed so that they represented about the same quantity of feed in one part of the country as in another in 1940-45. An "average" milk cow in the United States is used as the base animal unit in this study. An average milk cow in New York consumes more feed than does the average cow in the United States and therefore is more than one animal unit, but in several other States the average milk cow is less than one unit. The method of computation and factors used in each State are given in F.M. 64.

It should be understood that the quantity of feed fed per head for some kinds of livestock may have changed since 1940-45 when the factors used in this report were constructed and that an animal unit in a State or even in the United States in 1954 may not represent the same quantity of feed as in 1940-45. The change may have been greater in some States than in others. The same qualification applies to the years before 1940. Horses and mules get less grain per head than they got 20 to 30 years ago, while milk cows eat more concentrates. Broilers use much less feed per head than they used 10 years ago. In constructing the animal units shown in this report, constant factors were used for years from 1909 to 1954. Livestock in cities are not included.

Table 1.- Grain-consuming livestock: Animal units fed in year beginning October 1, by States, 1919-20 to 1953-54
